## Log Analyser 6 For PC

Log Analyser 6 is a tool for Lotus Domino administrators to detect events in the Domino server log and report on them. This database searches the documents in the Miscellaneous Events and Mail Routing Events views in the LOG.NSF database looking for keywords and upon detection create a report document which can also be sent via email. Give Log Analyser 6 a try to fully assess its capabilities! You need to add some sort of extraction tool for the email to get it out of the Notes Inbox and into a separate folder. I'm talking about using a UNIX program (the only one I know of for email is `mailx`). This is part of my master thesis. I have created a custom view, that will have a searchable html / sortable table. The table will show a list of customers and will have information about their contacts. I have hard coded the fields in the view and would like to add some sort of a sent-request in case the field is not filled in. I have this good feeling that it should be possible and I have found some posts that seem promising, but I have yet to fully understand how to do it. So any help will be highly appreciated. Tranel: This is part of my master thesis. I have created a custom view, that will have a searchable html / sortable table. The table will show a list of customers and will have information about their contacts. I have hard coded the fields in the view and would like to add some sort of a sent-request in case the field is not filled in. I have this good feeling that it should be possible and I have found some posts that seem promising, but I have yet to fully understand how to do it. So any help will be highly appreciated. Do you have any webpages or documents describing the fields you've used in your view? As far as I understand it, it will be done automatically if you set the property RetrieveNonFilledFields = false in the view. You could also check out the SearchView control I'm developing. It might be what you're looking for. Regards TheDnB Logged Ethereal - Cooling - Slackware - Life is not a journey to the grave with the intention of arriving safely in a pretty and well-preserved body. Rather, it's a skid row, a no man's land,

## Log Analyser 6 Crack+ With Registration Code

Lotus Domino Log Analyser 6 is a tool for Lotus Domino administrators to detect events in the Domino server log and report on them. This database searches the documents in the Miscellaneous Events and Mail Routing Events views in the LOG.NSF database looking for keywords and upon detection create a report document which can also be sent via email. Give Log Analyser 6 a try to fully assess its capabilities! Log Analyser 6 Features: Sending of the logged reports via email (optional, but you get Lotus Domino support) Log events can be grouped by date (can be set) The description of the date can be changed This application can search for keywords within some documents This application provides an easy way to classify Domino actions such as messages, mail events, server events, sessions, etc. Dates of events are automatically tagged with the current date and time Log files can be located on the Domino server with a path provided. You can define other paths if Log Analyser 6 has to look for the log files in different locations Text (the logged event) can be searched ... and more Document Map The tool also provides a Map of all the files on the Domino server that are sent in the LOG.NSF database. You can search for documents in the database by using the keywords in the description of the document, by simply highlighting them with the mouse, or by checking a checkbox. Log Analyser 6.7 latest version description Log Analyser 6.7 latest version description Leo Log Analyser 6.7 is a tool for Lotus Domino administrators to detect events in the Domino server log and report on them. ## Log Analyser 6 [32|64bit]

Log Analyser 6 is a tool for Lotus Domino administrators to detect events in the Domino server log and report on them. This database searches the documents in the Miscellaneous Events and Mail Routing Events views in the LOG.NSF database looking for keywords and upon detection create a report document which can also be sent via email. Give Log Analyser 6 a try to fully assess its capabilities! Log Analyser 6 Functions: Log Analyser 6 is a Java application that can search through Domino log files for keywords and produce a formatted report detailing what events have occurred and when. The 'Optional' keyword is used to limit the report to specific systems that may require more information. Currently supported events: - General Domino Events (Mail Routing, Miscellaneous, Service Events) - Domino Notes Events (Changes, Changes unconfirmed, Reminders, Notes App Events) - Domino Security Events (Revocation, Permission Events) - Domino Access Control Events (Restrictions, Assignments, Security Events) - Domino Tags Events (Custom Tags, Nouns, Abbreviations) Optional events: - Domino Agent Servers - Legacy Domino Agent Servers - Lotus Notes Server (if installed on the same machine as your Domino Server) - User Agents (Applet, ActiveX, Browser) - Protocols (Internet, Proxys, IMAP, POP3) - Cache files (if location and filename is specified) - Config file (if location and filename is specified) - Network traffic (if Port and IP are specified) - Domino Shared Files (Documents, Attachments) - Lotus Notes Shared Files (Documents, Attachments) - Domino Attachments (Documents, Contacts, Calendar Attachments, eDirectory) - MIME (if MIME type is specified) - Lotus Domino Server Groups (if password for the group is specified) Log Analyser 6 Features: - Find Event Topics: Search for key words in any of the existing events for the Domino server. Results will have the Event Summary, Event Details, Event Category and Event Count columns with the list of events which had the keyword. - Find Events by Keywords: Search for specific keywords and apply exclusions if required. Results will have the Event Summary, Event Details, Event Category and Event Count columns with the list of events

## What's New in the?

Log Analyser 6 is a tool for Lotus Domino administrators to detect events in the Domino server log and report on them. This database searches the documents in the Miscellaneous Events and Mail Routing Events views in the LOG.NSF database looking for keywords and upon detection create a report document which can also be sent via email. Give Log Analyser 6 a try to fully assess its capabilities! Notes\_Column 1 and Notes\_Column 2 allow the user to re-order the columns and change column headings. It now supports the following new fields: Notes\_SearchWord Notes\_SearchWord This is the search word used in the search. It can be easily modified with the Notes\_SearchWordEdit view in the Admin Console. Notes\_SearchType Notes\_SearchType This is the search type that is being used in the search. There are two search types: Whole Words Search and Fuzzy Search. In Whole Words Search the search term must be present in the entire data item. In Fuzzy Search only part of the term is required to match the data item. If the search type is Whole Words Search then the Match All option is enabled. If the search type is Fuzzy Search then the Match Any option is enabled. Notes\_SearchColumns Notes\_SearchColumns This is the list of columns the search should be applied to. Notes\_SearchOrder Notes\_SearchOrder If set to Notes\_SearchType (that is, this is whole words) this value is the order in which the search should be performed. Notes\_SearchDirection Notes\_SearchDirection If set to Notes\_SearchType (that is, this is whole words) this value is the direction in which the search should be performed. Notes\_SearchState Notes\_SearchState If set to Notes\_SearchType (that is, this is whole words) this value is the search state, which is usually 0 (not completed), 1 (in progress) or 2 (completed). Notes\_SearchKeywords Notes\_SearchKeywords This is the list of keywords that should be found in the data item. Notes\_SearchTime Notes\_SearchTime This is the time that the search took to run. Notes\_SearchUpdate Notes\_SearchUpdate
